Project #1: Adobe MAX Flyer Memo

When designing my flyer, the first, and in my opinion, most important decision I made was to insert a photo of Miami as my background. I did this to add some sophistication to my flyer, but made sure to include an image that did not distract too much from the text information. Additionally, I added a filter to the background photo to give it a warmer look. This background image set the groundwork for the rest of my flyer, as I decided to go for a vintage beachy composition, almost like an old postcard. The reason this choice makes my flyer effective is because this aesthetic creates an immediate attention-grabbing appeal that audiences can latch on to.

I then decided to clip and add a shadow effect to both the STCO and Adobe MAX logos. I did because I felt like the logos matched the aesthetic of the flyer best, instead of the logos with their included background designs, as I felt it appeared too “blocky” on the flyer. I also added a shadow to both logos so that they contrasted slightly against the background image. I added these images to the bottom of the flyers, as I felt that the official company certifications were not as important to advertise as the event itself was. This choice allows my audience to be more immediately captured by essential information, as opposed to information that is not as important.

Then I began to focus on the hierarchy and text information part of designing the flyer. I wanted my most attention-grabbing part to be the “Adobe MAX” text, since this was the part I really wanted to advertise and push to my audience. I decided to not only format it in a cursive font with a color that contrasts the background, but I also added an inner shadow and small stroke to provide further contrast, making it more attention-grabbing. I then include texts like “STCO” and “MIAMI” around the “Adobe MAX” as I felt these characteristics were essential to the trip’s advertising. I formatted these text pieces similarly to that of a vintage beach postcard as a way to match my intended aesthetic. The reason all of these decisions work is because they are the most important pieces of information, so it is essential that their hierarchy reflects that. These decisions and aspects of my design give the audience something to immediately latch on to visually.

Lastly, I created a burgundy rectangle, which allowed my text with the event information to be more visible on the flyer. I also added a small stroke on both the text and the rectangle to create a clearer contrast with the beach background and the rectangle. To prevent my flyer from being too wordy, I created a QR code that links to a document with additional information about the conference. The reason these choices work is because I have created an image that is clearly legible and attention-grabbing for my audience to consume.
